

Ryan White HIV/AIDS Program

Annual Client-Level Data Report

Ryan White HIV/AIDS Program Services Report

2020

The *Ryan White HIV/AIDS Program Annual Client-Level Data Report* is published by the Division of Policy and Data, HIV/AIDS Bureau (HAB), Health Resources and Services Administration (HRSA), U.S. Department of Health and Human Services, Rockville, Maryland.

Data are presented for clients reported to the HRSA HAB Ryan White Services Report (RSR; non-AIDS Drug Assistance Program [ADAP]) data system for calendar years 2016 through 2020.

The *Ryan White HIV/AIDS Program Annual Client-Level Data Report* is not copyrighted and may be used and copied without permission. Citation of the source is, however, appreciated.

Acknowledgments

Publication of this report was made possible by the Ryan White HIV/AIDS Program grant recipients and subrecipients that provided RSR data to HRSA.

The HRSA HIV/AIDS Bureau would like to acknowledge the important work Ryan White HIV/AIDS Program recipients, subrecipients, and stakeholders have been doing in response to the coronavirus disease 2019 (COVID-19) public health emergency and the incredible efforts made to submit high-quality, complete RSR data in a timely manner during this time.

COMMENTARY

The Ryan White HIV/AIDS Program (RWHAP) supports direct health care and support services for more than half a million people with HIV—more than half of all people with diagnosed HIV in the United States (U.S.) [1]. The RWHAP funds and coordinates with cities, states, and local community-based organizations to deliver efficient and effective HIV care, treatment, and support services for low-income people with HIV. Since it was established, the RWHAP has developed a comprehensive system of safety net providers who deliver high-quality, direct health care and support services. The RWHAP is critical to ensuring that individuals with HIV are linked to and retained in care, are able to adhere to medication schedules, and remain virally suppressed. People with HIV who reach and maintain an undetectable viral load can live a close to normal life-span and have effectively no risk of sexually transmitting the virus to an HIV negative partner. RWHAP services are crucial for attaining optimal HIV health outcomes among people with HIV, preventing further transmission of the virus, and—ultimately—ending the HIV epidemic in the U.S.

The Legislation

The U.S. Department of Health and Human Services (HHS), Health Resources and Services Administration (HRSA), HIV/AIDS Bureau (HAB) administers the RWHAP. In 1990, Congress passed the Ryan White Comprehensive AIDS Resources Emergency (CARE) Act to address the crisis of the HIV epidemic in the United States. This legislation has been amended and reauthorized four times—in 1996, 2000, 2006, and, most recently, in 2009 as the Ryan White HIV/AIDS Treatment Extension Act of 2009.

The RWHAP was funded at \$2.39 billion in fiscal year (FY) 2020 and is the largest federal program focused exclusively on HIV care, treatment, and support services. The RWHAP leverages other funding sources and health care coverage opportunities for people with HIV.

The RWHAP has five statutorily defined Parts that provide funding for medical and support services, technical assistance, clinical training, and the development of innovative models of care to meet the needs of different communities and populations affected by HIV:

- **Part A** provides funding to Eligible Metropolitan Areas (EMAs) and Transitional Grant Areas (TGAs) severely affected by the HIV epidemic. Grant funds assist eligible jurisdictions to develop or enhance access to a comprehensive continuum of high-quality, community-based care for low-income people with HIV through the provision of formula, supplemental, and Minority AIDS Initiative funds. Eligibility for RWHAP Part A grants is based, in part, on the number of confirmed AIDS cases within a statutorily specified “metropolitan area.” HHS uses the Office of Management and Budget (OMB) census-based definitions of a Metropolitan Statistical Area (MSA) to determine the geographic boundaries of an RWHAP metropolitan area, based on the boundaries in effect when a jurisdiction initially received RWHAP Part A funding. For all newly eligible areas, HHS bases the boundaries on current OMB MSA boundary definitions. To qualify for EMA status, an area must have reported more than 2,000 AIDS cases in the most recent 5 years and have a population of at least 50,000. To be eligible for TGA status, an area must have reported 1,000 to 1,999 AIDS cases in the most recent 5 years and have a population of at least 50,000. EMAs and TGAs range in size from one city or county to more than 26 different geographic entities; 11 EMAs/TGAs have service areas that cross state lines.
- **Part B** provides funding to all 50 states, the District of Columbia, the Commonwealth of Puerto Rico (hereafter referred to as Puerto Rico), the Northern Mariana Islands, American Samoa, Guam, the U.S. Virgin Islands, the Federated States of Micronesia, the Republic of the Marshall Islands, and the Republic of Palau (hereafter referred to collectively as state(s)/territory(ies)) to support HIV care and treatment services for low-income people with HIV.

- The RWHAP Part B grants include funding for the AIDS Drug Assistance Program (ADAP) to fund medication and health care coverage.
- **Part C** provides funding to local community-based organizations, community health centers, health departments, academic medical centers, and hospitals in 49 states, the District of Columbia, Puerto Rico, and the U.S. Virgin Islands to provide comprehensive primary medical care and support services in an outpatient setting for low-income people with HIV. The RWHAP Part C funds also may support capacity development grants to strengthen organizational infrastructure and develop, enhance, or expand access to high-quality primary medical care for people with HIV.
- **Part D** provides funding to local community-based organizations, community health centers, health departments, academic medical centers, and hospitals in 39 states and Puerto Rico to support family-centered HIV primary medical care and support services in an outpatient setting (directly or through contracts or memoranda of understanding) for low-income women, infants, children, and youth with HIV and their affected family members.
- **Part F** provides funds for the following programs:
 - The Special Projects of National Significance (SPNS) Program supports the development, implementation, and evaluation of evidence-based, evidence-informed, and emerging interventions for HIV care and effective service delivery systems for people with HIV. The RWHAP SPNS Program also supports the dissemination of successful interventions and supports the replication and integration of these interventions by RWHAP-funded recipients.
 - The AIDS Education and Training Centers (AETC) Program works to increase the number of health care providers who are competent and willing to counsel, diagnose, treat, and medically manage individuals with HIV by providing education, training, consultation, and clinical decision support to health care professionals at the local and regional levels.
 - The Dental Programs provide funding for oral health care for people with HIV and support training dental and dental hygiene providers.
 - The Minority AIDS Initiative provides funding to evaluate and address the disproportionate impact of HIV on Blacks/African Americans and other minority populations.

Together, the Parts of the RWHAP provide the public health infrastructure needed to ensure access to a wide range of core medical services (e.g., Outpatient Ambulatory Health Services, Medical Case Management, Mental Health Services) and support services (e.g., Non-Medical Case Management, Housing, Transportation, Food Bank/Home Delivered Meals) aimed at early diagnosis of HIV, linkage to care, retention in care, medically appropriate treatment, and sustained viral suppression.

Ending the HIV Epidemic in the U.S.

The RWHAP goals align with two complementary national efforts, the *Ending the HIV Epidemic (EHE) in the United States* initiative [2] and the *National HIV/AIDS Strategic Plan 2021–2025 (NHAS)*, to reduce new HIV infections by 90% by 2030. The EHE initiative, which began in FY 2020, intends to reduce new HIV infections to fewer than 3,000 per year by 2030 by focusing on increased linkage to, re-engagement in, and retention in HIV care and treatment. Reducing new infections to this level essentially would mean that HIV transmissions would be rare and meet the definition of ending the epidemic. Correspondingly, the *NHAS* aims to prevent new HIV infections, improve HIV-related health outcomes for those with HIV, reduce HIV-related disparities and health inequities, and achieve integrated and coordinated efforts to address the HIV epidemic. HRSA's RWHAP plays a key role in providing care and treatment to people with new HIV diagnoses, people with HIV who are re-engaged in care, and people with HIV who are in care but not virally suppressed, as well as continued care for the more than half a million people served by the RWHAP annually.

2020 RWHAP Client-Level Data Report Overview

This report is HRSA HAB's annual publication of national RWHAP client-level data from the RWHAP Services Report (RSR). The RSR data are HRSA HAB's primary source of annual, client-level data reported by more than 2,000 funded grant recipients and subrecipients.

Client-level RSR data are available beginning with the 2010 data and are used to assess the numbers and demographics of clients receiving RWHAP services, understand client HIV-related outcomes, and identify and address HIV-related disparities. This information is a crucial component of data-driven program decision-making and improved health equity. Project Officers at HRSA HAB can discuss the data with recipients to monitor and support their progress to improve HIV care and treatment for people with HIV. It is through the hard work of these providers and the RWHAP community that clients receive help every day.

This report includes data submitted to the RSR for all clients served by RWHAP Parts A, B, C, and D during calendar years 2016 through 2020, regardless of the source of RWHAP funding. That is, the data presented are not specific to any one Part, regardless of geographic area presented (e.g., state-level, EMA/TGA-level). RSR data do not include information about ADAP; all ADAP-related information is reported through the ADAP Data Report and is disseminated in another publication [3]. Although data presented here are "non-ADAP," many clients also receive ADAP services.

The RSR data presented in this report highlight the state of the RWHAP and include the demographic composition of clients served; socioeconomic factors, such as federal poverty level (FPL), health care coverage, and housing status; and the results of focused analyses to measure progress toward achieving select HIV-related clinical outcome indicators [4,5]. The data are inclusive of the overall RWHAP client population and priority populations. This report does not include the specific services provided to individuals. All tables include all clients served, regardless of the RWHAP services rendered (unless otherwise noted; e.g., viral suppression tables) or source of RWHAP funding (i.e., data from Parts A, B, C, and D are included in all tables).

Tables displaying demographic and socioeconomic data (Table 1a, Tables 2 through 8, and Tables 20a through 25b) include all RWHAP clients, regardless of HIV serostatus¹ (hereafter referred to as *HIV status*). That is, the data include people with HIV, as well as clients missing HIV status information (e.g., clients who receive services that do not require HIV status to be reported, such as Medical Transportation services) and clients who do not have HIV (i.e., the families of people with HIV are able to receive certain RWHAP services). In 2020, people with HIV represented 98.7% of all clients. Table 1b and tables displaying retention in care and viral suppression data (Tables 9 through 18b and Tables 26a through 35b) include only people with HIV who meet the criteria for the specified analysis (see Technical Notes). The tables include data reported from 50 states, the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands. However, due to reporting challenges during the coronavirus disease 2019 (COVID-19) pandemic, Guam's 2019 and 2020 RSR data are unavailable. Tables 19a through 35b display data by state and EMA/TGA. Readers are encouraged to review all table titles and footnotes carefully to ensure a complete understanding of the data presented.

Readers should interpret RWHAP retention in care and viral suppression data carefully. RWHAP recipients and subrecipients report RSR client-level data annually and the data are de-identified when reported. As a result, it is not possible to link client-level data across years, which affects how HIV-related outcomes are calculated in this report. Specifically, HRSA HAB measures retention in care among RWHAP clients with HIV who received at least one Outpatient Ambulatory Health Services (OAHS) visit before September 1 of the calendar year (i.e., January 1 through August 31), thereby

¹ The state of either having or not having detectable antibodies against a specific antigen, as measured by a blood test (serologic test). For example, HIV seropositive means that a person has detectable antibodies to HIV; HIV seronegative means that a person does not have detectable HIV antibodies (<https://clinicalinfo.hiv.gov/en/glossary/serostatus>).

allowing a second care visit to occur at least 90 days later during that calendar year. HRSA HAB measures viral suppression specifically among RWHAP clients who received at least one OAHS visit any time during the calendar year and who had at least one viral load test result reported; that is, viral suppression is among people with HIV who received medical care by RWHAP providers during the year and had at least one viral load test.

As a result of the above specifications about the retention in care and viral suppression calculations, the numbers of people with HIV included in these analyses are not equal to the total number of people with HIV served by the RWHAP; the subset of clients for retention in care analyses is 63% of the total RWHAP client population with HIV, and the subset for viral suppression is 65%. Clients not included in retention in care or viral suppression calculations may have received any other RWHAP service (e.g., Medical or Non-Medical Case Management, Housing, Transportation, Food Bank/Home Delivered Meals). It is also important to note that many of the clients not included in calculations for retention in care and viral suppression (i.e., those who did not receive RWHAP OAHS) receive medical care at RWHAP clinics, where primary medical care services are paid using non-RWHAP funding sources (e.g., private, public, or other health care coverage types), or receive care from providers outside the RWHAP system; these clients should not be presumed to be “out of care.”

Monitoring HIV-Related Health Outcomes

RWHAP recipients and subrecipients submit select client-level HIV-related clinical data (e.g., OAHS visit dates and viral load test results) to HRSA HAB that assist with monitoring progress toward achieving the goals of the EHE initiative. HRSA HAB uses these data to calculate retention in HIV medical care and viral suppression among clients receiving RWHAP OAHS. This report displays these data for the RWHAP client population of people with HIV receiving OAHS by demographics, state, and EMA or TGA (Tables 9, 10, and 26a through 35b).

Because of notable disparities, HRSA HAB enhanced its efforts to improve HIV-related health outcomes among several priority populations: women; people of transgender experience; gay, bisexual, and other men who have sex with men (MSM); Black/African American and Hispanic/Latino populations; youth (aged 13–24 years); young Black/African American MSM; young Black/African American women; people with injection drug use reported as a transmission category; and people with unstable housing. Tables 11a through 18b display retention in care (“a” tables as well as Table 12b) and viral suppression (“b” tables except for Table 12, which show those data in the “c” and “d” tables) for these priority populations.

Report Changes

HRSA HAB periodically updates the RSR to most accurately measure the full investment of the RWHAP and demonstrate its impact at the state and local levels. As a payor of last resort, RWHAP funds cannot be used to pay for services that have been or reasonably can be expected to be covered by another payment source. However, more recipients have been moving toward funding services with RWHAP-related funding (i.e., program income, pharmaceutical rebates). To fully measure RWHAP investments and impact, beginning with the 2019 data, HRSA HAB encourages recipients and subrecipients to also include RSR data on clients receiving services provided using RWHAP-related funding; this will become a reporting requirement for all RWHAP recipients and subrecipients beginning with the 2021 data year (to be reported in early 2022). The increased number of clients in the 2019 data likely reflect these reporting changes. It is important to note that this new reporting requirement did not replace the previous eligible scope reporting requirement, but rather expands upon the previous requirement.

HAB EHE initiative and RWHAP Fiscal Year (FY) 2020 Coronavirus Aid, Relief, and Economic Security (CARES) Act–funded recipients and service providers reported aggregate-level data through the EHE Triannual Module and COVID-19 Data Report systems (respectively). Client-level data for people with HIV receiving HAB EHE funded services and RWHAP FY 2020 CARES Act–funded services were included in the 2020 RSR data submission.

The COVID-19 pandemic emerged during the 2019 RSR data submission period and continued through the 2020 submission period. HRSA HAB acknowledges the incredible efforts recipients and subrecipients made to report data in a timely fashion throughout this time. Because of pandemic-related challenges, however, the U.S. territory of Guam was unable to submit data by the deadline needed for data processing. Therefore, the 2019 and 2020 data do not include Guam’s data, nor are these data shown for state/territory-specific tables (“a” tables from 19 to 35). Among RWHAP clients in all states and territories, the 2020 data reflect slightly decreased numbers compared to 2019, possibly due to a variety of pandemic-related factors, such as physical operation closures and shifts to telehealth service delivery (Table 1a).

HIGHLIGHTS OF ANALYSES

Ryan White HIV/AIDS Program Clients

The RWHAP serves more than half a million people each year. In 2020, 561,416 clients received services from RWHAP-funded providers (Table 1a). Among all RWHAP clients served in 2020, 98.7% (553,953) were people with HIV (Table 1b), which has been relatively consistent since 2016. From 2019 through 2020, the total number of RWHAP clients decreased by approximately 6,000, which may be due in part to factors related to the COVID-19 pandemic.

The age distribution is shifting among RWHAP clients. From 2016 through 2020, the percentage of clients in each 5-year age group from 40 to 54 years decreased (combined, 40.3% of the RWHAP population was aged 40–54 years in 2016, decreasing to 33.4% in 2020), whereas the percentage increased in each 5-year age group among those aged 55 years and older (combined, from 27.7% in 2016 to 34.6% in 2020; Table 1a). In total, this amounts to an increase of more than 41,000 clients aged 55 years and older in the five-year period, of whom nearly half (48.2% or 19,991 clients) were aged 65 years and older in 2020. In 2020, clients aged 65 and older accounted for more than one-quarter (27.4%) of those aged 55 and older.

Nearly three-quarters of RWHAP clients are from racial/ethnic minority populations. The percentage distribution of client race/ethnicity populations has remained consistent since 2016. In 2020, 46.6% of clients self-identified as Black/African American, 26.4% as White, 23.6% as Hispanic/Latino, and less than 2% each as American Indian/Alaska Native, Asian, Native Hawaiian/Pacific Islander, and people of multiple races (Table 1a).

The majority of RWHAP clients are male. In 2020, 72.0% of clients were cisgender male (i.e., non-transgender male; hereafter referred to as *male*), 25.9% were cisgender female (hereafter referred to as *female*), and 2.1% identified as transgender (1.8% transgender female [i.e., assigned male sex at birth]; 0.2% transgender male [i.e., assigned female sex at birth]; 0.1% clients with another gender identity; Table 1a). The gender distribution of RWHAP clients has remained largely consistent since 2016. Please see Technical Notes for additional information about gender categories.

By race/ethnicity, the ratio of males to females differed (Table 2). In 2020, the ratio for the overall RWHAP population was 2.8 males for every 1 female client. The ratio of White males to White females was 5.2 to 1 (82.9% and 16.0%, respectively), 3.5 to 1 for Hispanic/Latino males to Hispanic/Latina females (76.0% and 21.5%, respectively), and 1.9 to 1 for Black/African American males to Black/African American females (63.5% and 34.2%, respectively).

There were also gender variations by age group. The proportion of female clients linearly increased with age group, peaking among those aged 55–59 years. Compared to female clients, in 2020 there was a higher proportion of male clients aged 20–39 years and a lower proportion among those aged 40–59 years (Table 3). Similarly, higher proportions of transgender clients were aged 20–39 years and lower proportions were aged 55 years and older compared to both male and female clients.

Socioeconomic Factors and Health Care Coverage

Nearly two-thirds of RWHAP clients are living at or below 100% of the FPL. In 2020, 60.9% of clients were living at or below 100% FPL, a slight decrease from 2016 (62.8%; Table 1a).

The percentages of clients living at or below 100% FPL differ by race/ethnicity. The percentages of American Indian/Alaska Native, Black/African American, and Hispanic/Latino clients living at or below 100% FPL (67.5%, 66.0%, and 63.6% respectively) were higher than that among clients of other races (multiple races, 61.2%; Native Hawaiian/Pacific Islander, 58.9%; Asian; 52.3%; White, 50.0%; Table 5, percentages presented in the table are column percentages, and those presented here are row percentages).

Higher percentages of female and transgender female clients are living at or below 100% FPL compared to male clients. Among the 132,679 female clients with FPL information in 2020, 69.7% (92,500) were living at or below 100% FPL (Table 3). Among the 9,308 transgender female clients with FPL information in 2020, 77.2% (7,183) were living at or below 100% FPL. Comparatively, 57.4% of male clients (213,102 of 371,470) with FPL information were living at or below 100% FPL.

Approximately 80% of RWHAP clients have some form of health care coverage. Among all RWHAP clients in 2020, 30.8% were covered by Medicaid, 10.6% were covered by Medicare, 10.1% had private employer coverage, and 9.8% had multiple forms of coverage (Table 1a; multiple coverages include any combination of health care coverage types, *except* those who had Medicaid *and* Medicare [dual eligibility], which is displayed separately [7.5% of clients]. See Technical Notes for additional information). One-fifth (19.4%) of RWHAP clients had no health care coverage in 2020, which has been consistent since 2016.

Approximately 7% of RWHAP clients have temporary housing and nearly 5% have unstable housing. The distribution of RWHAP clients by housing status has remained relatively stable since 2016 (Table 1a). However, data illustrate a small increase in the percentage of clients with stable housing, from 86.1% in 2016 to 88.3% in 2020.

In 2020, by age group, the highest proportions of clients with temporary or unstable housing were among those aged 20–24 years (9.7% and 5.5%, respectively), 25–29 years (9.3% and 6.5%), 30–34 years (6.7% and 8.9%), and 35–39 years (8.5% and 6.5%) (Table 6; percentages presented in the table are column percentages, and those presented here and below are row percentages).

RETENTION IN CARE AND VIRAL SUPPRESSION HIGHLIGHTS

Retention in HIV Medical Care

HRSA HAB calculates retention in care among RWHAP patients with HIV who had at least one OAHS visit by September 1 of the measurement calendar year; patients are considered retained if they had a second visit at least 90 days after.

Retention in care remained relatively stable, at approximately 80% year-to-year during 2016 through 2020. In 2020, 79.4% of 346,796 OAHS patients were retained in HIV care (Table 9), a slight decrease (1.4 percentage points) compared to 2019. While these data do not delineate the factors contributing to this decrease, and similar minor fluctuations occurred in years prior, it is possible that the COVID-19 pandemic affected clients' access of services.

Across subpopulations, retention in care was generally consistent with the overall average (Table 9). However, a few subpopulations had lower retention in care percentages (lower than the national RWHAP average of 79.4% by at least 5 percentage points): patients aged 25–29 years (74.1%), patients with Veterans Administration (69.1%) health care coverage, and patients with unstable housing (72.7%).

Two trends emerge when examining retention in care among subpopulations from 2016 through 2020. First, retention in care was slightly lower among patients with income levels greater than 250% FPL year-to-year compared to those with lower income levels. Second, the percentage of patients retained in care by 5-year age group forms a reverse bell curve, with older and younger populations more likely to be retained and the lowest pinnacle occurring among those aged 25–29 years.

Viral Suppression

Viral suppression was calculated among people with HIV who had at least one OAHS visit and at least one viral load test during the measurement calendar year. Viral suppression was defined as a most recent viral load test result of <200 copies/mL.

Nearly 90% of RWHAP OAHS patients reached viral suppression in 2020. In 2020, 89.4% of 357,914 OAHS patients had a suppressed viral load at their most recent test (Table 10). From 2016 through 2020, viral suppression increased 4.5 percentage points, from 84.9% in 2016 to 89.4% in 2020; of note, despite the complexities that arose in the provision of care as a result of the COVID-19 pandemic, the percentage of patients achieving viral suppression increased by 1.3 percentage points from 2019 (88.1%) to 2020 (89.4%).

Young people aged 15–24 years made great progress improving viral suppression from 2016 through 2020. In 2020, viral suppression was 81.1% among patients aged 15–19 years and 81.4% among those aged 20–24 years (Table 10). Although these percentages are the lowest by age group, they reflect an approximately 10 percentage point increase for both of these groups from 2016 through 2020.

The percentage of transgender women (aged >13 years) reaching viral suppression continues to increase. In 2020, 84.2% of transgender women reached viral suppression, which reflects a 5.2 percentage point increase from 2016 (79.0%; Table 10).

Viral suppression improved for OAHS patients with temporary and unstable housing, but more work is needed. In 2020, 76.8% of patients with unstable housing reached viral suppression, compared with 72.0% in 2016 (Table 10). Viral suppression among this population remained around 72.0% from 2016 through 2018, so the more recent upward trend is encouraging. There was a 4.9 percentage point increase in viral suppression for patients with temporary housing from 2016 through 2020 (from 78.9% to 83.8%). By comparison, patients with stable housing saw steady improvements in viral suppression (approximately 1 percentage point increase each year, from 86.1% in 2016 to 90.4% in 2020). Patients with unstable and temporary housing continue to have disparately lower levels of viral suppression compared to those with stable housing.

Retention in Care and Viral Suppression Among Priority Populations

This section reviews overall retention in care and viral suppression in 2020 for each priority population and highlights the subpopulations with the lowest percentages. Generally, this includes subpopulations with outcomes at least 5 percentage points lower than that of the overall priority population. Data for subpopulations with numbers less than 100 are not included in the highlights because of the variability in percentages resulting from small numbers.

Black/African American women (Tables 11a/b): Overall, the percentages of Black/African American women retained in care (81.0%) and virally suppressed (88.4%) were relatively consistent with the national RWHAP averages (79.4% and 89.4%, respectively).

Among Black/African American women, retention in care was lowest within certain demographic subgroups, including those aged 25–29 years (75.6%) and those in HHS Regions 5, 8, and 10 (73.0%, 76.0%, and 70.1%, respectively; see Technical Notes for states/territories included in each region).

Percentages of viral suppression among Black/African American women were lowest among those in each 5-year age group from 15 to 34 years (range: 75.8%–81.9%), those with perinatal HIV (74.4%); and those with temporary (83.0%) or unstable (77.7%) housing. In all but four subpopulations of women, viral suppression was lower among Black/African American women than among women overall in that subpopulation. This trend intensified when comparing Black/African American women to White women. In some subpopulations, the proportion of Black/African American women who were virally suppressed was 10 to 15 percentage points lower than that of White women; notably, among those with perinatal HIV (12.6 percentage point gap).

Black/African American men (Tables 12a/c): The overall percentage of Black/African American men who were retained in care (78.1%) was relatively consistent with the national RWHAP average (79.4%) and the average among all men (78.7%), but the percentage of those who achieved viral suppression (86.0%) was slightly lower than the RWHAP average (89.4%) and the average among men overall (89.5%).

A lower percentage of Black/African American men were retained in care than the average among all men in more than half of subpopulation groups. Retention in care was lowest among those aged 25–29 years (72.8%); those in HHS Regions 5, 8, and 10 (71.5%, 66.3%, and 70.4%, respectively); those with Veterans Administration health care coverage (63.8%); and those with temporary (72.7%) or unstable (72.3%) housing.

Viral suppression was lowest among Black/African American men in each 5-year age group from 15 to 29 years (range: 78.0%–80.8%), those with perinatal HIV (75.7%), those with no health care coverage (80.2%), and those with temporary (80.1%) or unstable (75.1%) housing.

Percentages of Black/African American men who are virally suppressed were particularly lower than those of White men. This gap was the widest among those in each 5-year age group from 20 to 34 years, those with perinatal HIV or male-to-male sexual contact transmission categories; those living at or below 250% FPL; those with Medicaid, Medicaid and Medicare dual coverage, other plan, no coverage, and multiple health care coverages; and those with stable or temporary housing.

Hispanic/Latina women (Tables 11a/b): Overall, higher percentages of Hispanic/Latina women were retained in care (85.5%) and virally suppressed (91.1%) than the national RWHAP averages (79.4% and 89.4%, respectively).

Among Hispanic/Latina women, retention in care was lowest among those aged 20–24 years (78.7%) and 30–34 years (80.5%); those in HHS Regions 5, 7, 8, and 10 (79.1%, 78.0%, 71.7%, and 68.9%, respectively); those living at greater than 400% FPL (79.5%); and those with temporary housing (80.3%).

The lowest percentages of viral suppression were among Hispanic/Latina women in each 5-year age group from 20 to 34 years (79.6%, 81.4%, and 85.9%, respectively); those with perinatal HIV (77.6%), and those with temporary (85.5%) or unstable (77.8%) housing.

Hispanic/Latino men (Tables 12a/c): Overall, retention in care (81.9%) and viral suppression (91.4%) among Hispanic/Latino men were slightly higher than the national RWHAP averages (79.4% and 89.4%, respectively).

Retention in care was lowest among Hispanic/Latino men aged 25–29 years (76.4%); those with perinatal HIV (76.7%); those in HHS Region 5, 8, and 10 (75.2%, 68.8%, and 70.4%, respectively); and those with unstable housing (75.1%).

Viral suppression was lowest among Hispanic/Latino men aged 15–19 years (83.9%) and 20–24 years (85.6%); those with HIV attributed to male-to-male sexual contact *and* injection drug use (85.8%) or perinatal HIV (77.8%); and those with unstable housing (80.1%).

Transgender adults and adolescents (Tables 13a/b): Overall, retention in care (77.2%) for transgender adults and adolescents was relatively consistent with the national RWHAP average (79.4%), but viral suppression (84.5%) was lower than the RWHAP average (89.4%).

Among transgender patients, retention in care was lowest among those aged 20–24 years (69.4%); those in HHS Regions 5 and 6 (71.4% and 71.8%, respectively); and those with unstable housing (69.3%).

Viral suppression was lowest among patients aged 20–24 years (73.9%) and 25–29 years (79.0%) and those with temporary (77.2%) or unstable (71.6%) housing. Generally, Black/African American transgender patients had lower percentages of viral suppression across demographic subgroups compared with Hispanic/Latino and White transgender patients.

Given the low numbers within the various subpopulations for transgender people, caution should be used when interpreting the percentages in Tables 13a/b.

Gay, bisexual, and other MSM (Tables 12b/d): Overall, retention in care (78.8%) and viral suppression (90.3%) for males with HIV attributed to male-to-male sexual contact (MSM) was relatively consistent with the national RWHAP averages (79.4% and 89.4%, respectively).

Across nearly all racial/ethnic groups, retention in care for MSM was lowest among those in HHS Regions 5, 8, and 10 (71.3%, 70.1%, and 67.3%, respectively), those with health care coverage through the Veterans Administration (68.8%), and those with unstable housing (73.6%).

The lowest percentage of viral suppression among MSM was among Black/African American MSM (85.5%), particularly among those aged 15 to 19 years (75.3%), those with no health care coverage (79.9%), and those with temporary (79.1%) and unstable (74.9%) housing. Viral suppression was also lower than overall MSM average among Hispanic/Latino MSM aged 15–19 years (83.1%) and those with unstable housing (83.0%). Among all MSM regardless of race/ethnicity, viral suppression was consistently lowest among MSM in each 5-year age group from 15 to 29 years (range: 77.7%–85.3%) and those with temporary (84.6%) or unstable (78.4%) housing.

Youth aged 13–24 years (Tables 14a/b): Among youth overall, retention in care (76.3%) was slightly lower than the national RWHAP average (79.4%), and viral suppression (81.5%) was substantially lower than the national RWHAP average (89.4%).

Among youth, the lowest percentages of retention in care were among those who identify as transgender (69.8%); those in HHS Region 10 (62.8%); and those with temporary (70.4%) or unstable (69.6%) housing.

Viral suppression was lowest among youth who identify as transgender (74.2%); transgender youth with HIV attributed to sexual contact (73.5%); and youth with temporary (76.3%) or unstable (69.6%) housing.

Given the low numbers within the various subpopulations for youth, caution should be used in interpreting the percentages in Tables 14a/b.

Young Black/African American MSM (YBMSM), aged 13–24 years (Tables 15a/b): Overall, retention in care for YBMSM (75.4%) was lower than the national RWHAP average (79.4%), but consistent with the average for young MSM overall (76.3%). Viral suppression for YBMSM (80.4%) was lower than the national RWHAP average (89.4%) by a considerable difference of 9 percentage points, but only slightly lower than the average for young MSM overall (83.3%).

For YBMSM, the lowest percentage of retention in care was among those in HHS Region 6 (69.3%) and those with temporary housing (65.5%), and viral suppression was lowest among those with temporary (73.9%) or unstable (75.1%) housing.

YBMSM living at or below 100% FPL had notably lower viral suppression compared with other racial/ethnic groups. Specifically, viral suppression among YBMSM living at or below 100% FPL (78.7%) was 7.5 percentage points lower than that among young Hispanic/Latino MSM (86.2%) and 5.3 percentage points lower than that among young White MSM (84.0%).

Given the low numbers within the various subpopulations of young MSM and YBMSM, caution should be used in interpreting the percentages in Tables 15a/b.

Young Black/African American women, aged 13–24 years (Tables 16a/b): Overall, retention in care for young Black/African American women (78.0%) was consistent with the national RWHAP average (79.4%) and with the average for young women overall (77.7%). Viral suppression for young Black/African American women (77.4%) was considerably lower than the national RWHAP average (89.4%) and slightly lower than the average for young women overall (79.7%).

The lowest percentages of retention in care for young Black/African American women were among those in HHS Region 6 (71.1%) and those with temporary housing (72.3%).

Viral suppression for young Black/African American women was lowest among those with temporary housing (70.2%).

Given the low numbers within the various subpopulations of young women and young Black/African American women, caution should be used in interpreting the percentages in Tables 16a/b.

Patients with HIV attributed to injection drug use (Tables 17a/b): Overall, for patients with HIV attributed to injection drug use, retention in care (80.2%) and viral suppression (88.2%) were consistent with the national RWHAP averages (79.4% and 89.4%, respectively).

Among all patients with HIV attributed to injection drug use, retention in care was generally lower among younger age groups and increased as age group increased; however, by race/ethnicity, retention in care was particularly low among White patients in each 5-year age group from 25 to 49 years (range 61.3%–72.7%) and among Black/African American patients aged 30–34 and 35–39 years (67.9% and 7.18%, respectively). Regardless of race/ethnicity, low retention in care was seen among patients with no health care coverage (72.7%) and those with “other plan” health care coverage (71.6%), as well as among patients with temporary (73.3%) or unstable (71.1%) housing. Additionally, retention in care was low among White patients, particularly those in HHS Regions 5, 7, and 8 (63.8%, 71.3%, and 69.8%, respectively); those with no health care coverage (71.3%); and those with temporary (69.2%) and unstable (67.4%) housing.

Viral suppression was lowest among patients with HIV attributed to injection drug use in each 5-year age group from 25 to 44 years (range: 78.7%–81.7%); those with no health care coverage (81.2%) and those with unstable housing (73.8%), regardless of race/ethnicity. Among White and Hispanic/Latino patients, viral suppression was also lower among those with temporary housing (81.3% and 82.5%, respectively).

Data for patients with HIV attributed to injection drug use are based on patients who reported “injection drug use” as their transmission category and may not reflect current behavior.

Housing status (Tables 18a/b): Among RWHAP patients, those with temporary or unstable housing consistently have lower retention in care and viral suppression compared to those with stable housing. This section provides highlights from the retention in care and viral suppression tables focused on housing status among RWHAP OAHS patients.

Overall, retention in care was higher among OAHS patients with stable housing (80.3%), compared with those with temporary (74.7%) or unstable (72.7%) housing. By region, the lowest percentages of retention in care were among patients with unstable housing receiving services in HHS Regions 7, 8, and 10 (65.1%, 56.9%, and 60.7%, respectively); and among patients with temporary housing receiving services in HHS Regions 5, 8, and 10 (66.6%, 69.6, and 68.1% respectively). By race/ethnicity, the lowest percentages were among patients with unstable housing who were American Indian/Alaska Native (66.1%) and patients of multiple races with temporary or unstable housing (67.3% and 63.8%, respectively). By age group, retention in care was consistently lower among patients younger than age 30 across all housing status categories.

Overall, the highest percentage of viral suppression was among those with stable housing (90.4%), whereas percentages among patients with temporary (83.8%) and unstable (76.8%) housing were substantially lower. Among patients with unstable housing, viral suppression was lowest among patients aged 20–24 years (69.8%), American Indian/Alaska Native patients (64.3%), transgender female patients (71.1%), and those receiving services in HHS Regions 2 (70.1%) and 7 (71.4%).

Across all genders, a substantially greater proportion of patients with stable housing reached viral suppression compared with those who had temporary or unstable housing. For example, viral suppression among transgender females with stable housing (86.2%) was 8.7 percentage points higher than that among transgender females with temporary housing (77.5%) and 15.1 percentage points higher than that among those with unstable housing (71.1%). There were similar percentage point differences for male and female patients.

TECHNICAL NOTES

Ryan White HIV/AIDS Program Data

The Ryan White HIV/AIDS Program (RWHAP) Services Report (RSR) is the U.S. Department of Health and Human Services (HHS), Health Resources and Services Administration (HRSA), HIV/AIDS Bureau's (HAB) primary source of annual, client-level data reported by more than 2,000 grant recipients and subrecipients. These data allow HRSA HAB and its stakeholders to assess the numbers and demographics of clients receiving services, understand client HIV-related outcomes, and identify and address HIV-related disparities. Client-level RSR data have been used since 2010. Each year, HRSA HAB requires grant recipients and subrecipients that use RWHAP funds to provide core medical or support services during the reporting period to submit data to in a specified format [6].

This report includes data reported to the RSR for all clients served by the RWHAP Parts A–D during calendar years 2016 through 2020. Beginning with the 2016 calendar year data collection period, recipients and subrecipients reported data for all clients who met the recipient's eligibility requirements for RWHAP participation (which varies by recipient and is based on criteria such as HIV status, income, and residency) and received at least one of the core medical or support services for which the recipient or subrecipient received RWHAP funding, regardless of the actual funding used to pay for the services (i.e., some services may have been paid for by sources other than the RWHAP). Because more recipients have been moving toward funding services with RWHAP-related funding (i.e., program income; pharmaceutical rebates), beginning with the 2019 data, HRSA HAB encourages recipients and subrecipients to also include RSR data on clients receiving services provided using RWHAP-related funding; this will become a reporting requirement for all RWHAP recipients and subrecipients beginning with the 2021 data submission. This new reporting requirement did not replace the previous eligible scope reporting requirement; rather, it expands upon the previous requirement.

In addition to the expanded scope of reporting clients served using RWHAP-related funds, data for people with HIV receiving RWHAP fiscal year (FY) 2020 Coronavirus Aid, Relief, and Economic Security (CARES) Act–funded services and HAB Ending the HIV Epidemic (EHE)–funded services were included in the 2020 RSR data submission.

RSR data do not include information about the AIDS Drug Assistance Program (ADAP), which is reported through another data system. Although data presented in this report are “non-ADAP,” many clients included in the RSR data also receive ADAP services.

After removing personally identifying information, recipients and subrecipients submit data to HRSA HAB. Data are reported by RWHAP grant recipients and subrecipients in 50 states, the District of Columbia, and three territories—Guam, Puerto Rico, and the U.S. Virgin Islands. Five of the six U.S. Pacific territories (excluding Guam) do not submit client-level data and, therefore, are not included in this report.

Presentation of Data

The data in this report include information received by HRSA HAB for clients served during calendar years 2016 through 2020. Data are organized into four sections:

- Section 1 (Tables 1–8): National-level numbers and percentages of clients served by the RWHAP (non-ADAP), presented by selected demographic stratifications
- Section 2 (Tables 9–18b): National-level retention in care and viral suppression among patients receiving outpatient ambulatory health services (OAHS), presented by selected demographics and priority population

- Section 3 (Tables 19a–25b): State- and Eligible Metropolitan Area or Transitional Grant Area (EMA/TGA)–level numbers and percentages of clients served by the RWHAP (non-ADAP), presented by selected demographics
- Section 4 (Tables 26a–35b): State- and EMA/TGA-level retention in care and viral suppression among patients receiving OAHS, presented by selected demographics

Tables 1–3 and 5–8 display subtotals for each subpopulation, as well as the overall total. Subtotals are displayed to reflect the denominator used for the percentage calculation of each subpopulation. Because of missing data, the values in each column may not sum to the column total.

HIV Status

RSR data include de-identified client-level information about people who received services from RWHAP-funded providers. RWHAP clients include people with HIV, as well as people who are affected by HIV (e.g., families and partners of people with HIV served by the RWHAP). Families of people with HIV are able to receive certain services through RWHAP Part D. The data presented in Table 1a, Tables 2 through 8, and Tables 19a through 25b include all RWHAP clients, regardless of HIV status. Table 1b and tables displaying retention in care and viral suppression (Tables 9 through 18b and Tables 26a through 35b) include only people with HIV.

Presumed HIV-positive status: Table 1b displays demographic data about clients with HIV only; however, many clients receive services that do not require HIV status to be reported (e.g., Medical Transportation) and, therefore, may be missing HIV status information. HRSA HAB applied an algorithm to estimate a “presumed HIV positive” status for Table 1b. That is, only six RWHAP-funded service categories are available to clients without HIV (i.e., Child Care Services, Early Intervention Services, Food Bank/Home-Delivered Meals, Other Professional Services, Outreach Services, and Psychosocial Support Services) [7]. Clients aged 13 years and older who received only one or a combination of these six services, without receiving another service available to only people with HIV, were presumed to be HIV negative. All other clients (aged 13 years and older) were presumed to have HIV and were included in Table 1b. Clients younger than 13 years were not included in the algorithm because of an inconsistency in data reporting between 2014 and later years; however, testing the algorithm for 2016 through 2018 for the <13 age group produced effectively no difference from the number of clients with a reported HIV status. Therefore, the HIV status variable was used for clients aged <13 years across all years.

Age Group

RWHAP grant recipients and subrecipients report client birth year, which is used to calculate the client’s age during the designated year as a discrete variable. For tables displaying age groups (Tables 1a–13b and 17a–18b), client ages were categorized to align with the Centers for Disease Control and Prevention (CDC) National HIV Surveillance System (NHSS) age group delineations: <13 years (if applicable), 13–14, 15–19, 20–24, 25–29, 30–34, 35–39, 40–44, 45–49, 50–54, 55–59, 60–64, and ≥65 years [1].

In Tables 20a/b (State and EMA/TGA by age group), data are displayed using broader age group delineations: <13 years, 13–24, 25–34, 35–44, 45–54, 55–64, and ≥65 years.

Tables displaying retention in care and viral suppression for priority populations (Tables 11a–18b) include only clients aged 13 years and older. Tables 14a–16b focus more narrowly on youth and young adults aged 13–24 years.

Race/Ethnicity

Recipients and subrecipients report race/ethnicity information for RWHAP clients according to Office of Management and Budget (OMB) standards [8]. The OMB standards have five categories for race: American Indian or Alaska Native, Asian, Black or African American, Native Hawaiian or Other Pacific Islander, and White. The data on ethnicity have two categories: (1) Hispanic or Latino, and (2) not Hispanic or Latino. Race and ethnicity are submitted as separate variables and combined for analysis.

The race/ethnicity variable is categorized as American Indian or Alaska Native, Asian, Black or African American, Hispanic or Latino, Native Hawaiian or other Pacific Islander, White, and multiple races (two or more categories of race reported).

In this report, clients categorized as Hispanic/Latino may have had any race also reported. Clients categorized by race (e.g., Black/African American) are non-Hispanic/Latino; however, the number of clients reported in each “non-Hispanic/Latino” race category may include clients with missing data for Hispanic/Latino ethnicity.

HRSA HAB expects RWHAP grant recipients and subrecipients to make every effort to obtain and report race and ethnicity based on each client’s self-report. Self-identification is the preferred means of obtaining this information.

Gender

Gender designations in this report are cisgender (non-transgender) male, cisgender female, or transgender. Transgender is an umbrella term for people whose gender identity and/or expression is different from their sex assigned at birth. Because of the unique health needs of transgender people with HIV, they are discussed separately from cisgender people and are specifically identified as being transgender. HRSA HAB collaborated with the transgender community and other experts in sexual orientation and gender identity data collection methods to successfully designate transgender people receiving HIV care and treatment from RWHAP providers, in order to best inform program decisions.

Reporting and analysis to determine transgender identity

Transgender variable options for RSR data reporting include transgender female-to-male (FTM), transgender male-to-female (MTF), or transgender other, which includes people who do not identify with the provided transgender variable options and/or who do not identify with the binary options of male/female (e.g., nonbinary, two-spirit, genderqueer). Self-identification is the preferred means of obtaining this information.

During the period 2010 through 2013, RSR variables for gender included *current gender*, with the options of male, female, and transgender, and a subsequent variable for *transgender identity* (this variable captured FTM, MTF, and transgender unknown). In 2014, HRSA HAB began requiring recipients and subrecipients report gender using a multistep method: *sex assigned at birth* (male or female) was added, and the *current gender* variable was replaced with *current gender identity* (male, female, transgender); the *transgender identity* variable remained intact. Beginning with 2017 reporting, HRSA HAB further refined the *current gender identity* variable to include the options of male, female, FTM, MTF, and transgender other (previously *transgender unknown*); the transgender identity variable was removed, thus creating a two-step method for reporting and determining gender (i.e., sex assigned at birth and current gender identity).

Gender data displayed for 2016 were analyzed using the multistep method for determining gender identity, which takes into account *sex assigned at birth*, *current gender identity*, and *transgender identity* (i.e., the 2014 data reporting method described above). The 2017–2020 data use the two-step method (i.e., the 2017 method); when the reported *current gender identity* is different from the *sex assigned at birth*, the analysis determines gender using an algorithm designed specifically for this purpose.

Language used in this report

In this report, for analyses that include clients of all ages, cisgender male clients are referred to as *male*, cisgender female clients as *female*, transgender MTF clients as *transgender female*, and transgender FTM clients as *transgender male*. For analyses that include only clients aged 13 years and older, clients are referred to as *men*, *women*, *transgender women*, and *transgender men*, respectively. Clients designated under the *transgender other* variable option are referred throughout as *clients with another gender identity*, or in the data tables as *other gender identity*.

Transmission Category

Transmission category is the term for the classification that summarizes a client's possible HIV risk factor(s) at the time of HIV acquisition; the summary classification results from selecting—from a presumed hierarchical order of probability—the single risk factor most likely to have been responsible for transmission.

It is important to note that data by transmission category presented in this report are based on the reported risk factor *most likely to have been responsible for the original transmission of HIV; data may not reflect current behavior (e.g., injection drug use)*.

For tables displaying data for all clients served by the RWHAP (Table 1a, Tables 2 through 8, and Tables 19a through 25b), transmission category data include clients with known positive HIV status and those who have unknown HIV status (e.g., children with indeterminate status and clients with transmission category information but missing HIV status data).

Transmission categories are presented separately by gender (i.e., male, female, transgender).

- For male clients, transmission categories include male-to-male sexual contact, injection drug use, male-to-male sexual contact *and* injection drug use, heterosexual contact, perinatal, and other.
- For female clients, transmission categories include heterosexual contact, injection drug use, perinatal, and other.
- For transgender clients, transmission categories have been modified to better reflect the transgender experience of transmission risk while continuing to follow a relative hierarchy of likelihood for transmission. That is, transmission category data for transgender clients are presented as sexual contact, injection drug use, sexual contact *and* injection drug use, perinatal, and other.

HRSA HAB adapted the definitions of transmission categories from the CDC's NHSS definitions for transmission categories [1]. Clients with more than one reported risk factor are classified in the transmission category listed first in the hierarchy. The only exceptions are (1) men who had sexual contact with other men and who injected drugs and (2) perinatal; these groups make up separate transmission categories. The transmission categories are defined, in order of the hierarchy, as follows:

- *Male-to-male sexual contact*: Male clients who report sexual contact with other men and males who report sexual contact with both men and women.
- *Injection drug use*: Clients who report use of drugs intravenously or through skin popping.
- *Male-to-male sexual contact and injection drug use*: Male clients who report sexual contact with other men, or sexual contact with both men and women, *and* report the use of drugs intravenously or through skin popping.
- *Heterosexual contact*: Clients who report specific heterosexual contact with an individual with, or at increased risk for, HIV (e.g., a person who injects drugs).

- *Perinatal*: This category is exclusively for clients with perinatally acquired HIV. This category includes clients born after 1980 who are known to have HIV and whose infection is attributed to perinatal transmission, as well as infants with indeterminate HIV status.
- *Other*: Clients who report transmission from the receipt of transfusion of blood, blood components, or tissue and clients who report hemophilia/coagulation disorder. Beginning with 2014 data collection, unknown risk factor was no longer included in the classification of *other* transmission risk, nor was it collected as a separate category for the RSR. All analyses in this report include only blood transfusion or hemophilia/coagulation disorder in the *other* transmission category.

For transgender clients, the following transmission category hierarchy is used:

- *Sexual contact*: Transgender clients who report any sexual transmission risk.
- *Injection drug use*: Transgender clients who report use of drugs intravenously or through skin popping.
- *Sexual contact and injection drug use*: Transgender clients who report sexual contact *and* report the use of drugs intravenously or through skin popping.
- *Perinatal*: As above.
- *Other*: As above.

Tables 12b/d and 15a/b display retention in care and viral suppression among MSM aged 13 years and older and among young MSM aged 13–24 years, respectively. These tables include only those clients with HIV attributed to male-to-male sexual contact and exclude male-to-male sexual contact *and* injection drug use. Tables 17a and 17b display retention in care and viral suppression among people with HIV attributed to injection drug use, respectively. These tables include only those clients whose reported transmission category is injection drug use; male clients with male-to-male sexual contact *and* injection drug use, and transgender clients with sexual contact *and* injection drug use as their transmission category are not included.

Federal Poverty Level

Federal poverty level (FPL) characterizes the client’s income as a percentage of the FPL [9,10] at the end of the reporting period. For 2016 through 2020, federal poverty level was categorized as 0–100% FPL, 101–138% FPL, 139–250% FPL, 251–400% FPL, and >400% FPL.

Health Care Coverage

RWHAP grant recipients and subrecipients report all sources of health care coverage that each client had for any part of the reporting period. These data are categorized further for analysis. Health care coverage was categorized as private employer, private individual, Medicare, Medicaid, Medicare and Medicaid (dual eligibility), Veterans Administration, Indian Health Service, other plan, no coverage, and multiple coverages. The Medicaid classification also includes the Children’s Health Insurance Program (CHIP) and other public state health care coverage programs.

Housing Status

The housing status variable captures the client’s housing status at the end of the reporting period and is categorized as stable (e.g., permanent) housing, temporary housing, or unstable housing. The definitions for each of these categories are based on the Housing Opportunities for Persons with AIDS Program Annual Progress Report Measuring Performance Outcomes: form HUD-40110-C and the McKinney-Vento Act, Title 42 US Code, Sec. 11302, General definition of homeless individual [11,12].

Region

HHS uses 10 geographic designations for classifying regions of the United States, which encompass all states and territories. The classification of states and territories within these regions is as follows:

- **Region 1:** Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont
- **Region 2:** New Jersey, New York, Puerto Rico, U.S. Virgin Islands
- **Region 3:** Delaware, District of Columbia, Maryland, Pennsylvania, Virginia, West Virginia
- **Region 4:** Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee
- **Region 5:** Illinois, Indiana, Michigan, Minnesota, Ohio, Wisconsin
- **Region 6:** Arkansas, Louisiana, New Mexico, Oklahoma, Texas
- **Region 7:** Iowa, Kansas, Missouri, Nebraska
- **Region 8:** Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming
- **Region 9:** Arizona, California, Guam, Hawaii, Nevada
- **Region 10:** Alaska, Idaho, Oregon, Washington

The six U.S. Pacific territories are included in HHS Region 9; however, only Guam submits client-level data. The other jurisdictions, therefore, are not included in this report.

It is important to note that the COVID-19 pandemic emerged during the 2019 RSR data submission period and continued through the 2020 period, shifting the priorities for RWHAP recipients and subrecipients. Because of these challenges, the U.S. territory of Guam was unable to submit data by the deadline needed for data processing in 2019 and 2020. Therefore, the 2019 and 2020 data do not include Guam's data; in addition, these data are not shown for state/territory-specific tables ("a" tables from 19 to 35).

State

State data are displayed in "a" tables from 19a through 35a. State-level delineation of data is based on provider location rather than client location. Clients receiving services in multiple states are not included in state-specific totals; these clients make up less than 2% of the total RWHAP population.

In addition, state-level analyses include data submitted for all Parts of the RWHAP. That is, data presented by state are not limited to entities receiving RWHAP Part B funding; all tables include data for all clients served by RWHAP providers in the state, regardless of the source of RWHAP funding (i.e., data from Parts A, B, C, and D are included).

Eligible Metropolitan Areas (EMAs) and Transitional Grant Areas (TGAs)

Part A of the RWHAP provides emergency assistance to EMAs and TGAs that are most severely affected by the HIV epidemic. To qualify for EMA status, an area must have reported at least 2,000 AIDS cases in the most recent 5 years and have a population of at least 50,000. To be eligible for TGA status, an area must have reported 1,000–1,999 AIDS cases in the most recent 5 years and have a population of at least 50,000.

EMAs and TGAs range in size from one city or county to more than 26 different geographic entities; 11 include parts of more than one state.

The boundaries of EMAs and TGAs are based on the U.S. Census Bureau delineation of the metropolitan statistical area at the time of first eligibility. Client-level data are reported based on provider location, rather than client location.

EMA and TGA data are displayed in “b” tables from 19b through 35b. It is important to note that data shown for EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and TGAs. In addition, data presented for EMAs and TGAs are not limited to entities receiving RWHAP Part A funding; all tables include data for all clients served by RWHAP providers in the EMA or TGA, regardless of the source of RWHAP funding (i.e., Parts A, B, C, and D data are included).

Tables 21b, 30b, and 31b display EMA and TGA data by race/ethnicity. To protect the confidentiality of clients, values less than 5 were suppressed. In addition, to ensure values less than 5 cannot be calculated, all data on clients of multiple races have been suppressed. In Table 21b, the “Total” column on which percentages were based includes all clients with reported race/ethnicity information.

Similarly, Table 22b displays data by gender. To protect the confidentiality of clients, values less than 5 were suppressed and all data on clients whose gender is “other gender identity” have been suppressed. The “Total” column on which percentages were based includes all clients with reported gender information.

Retention in Care and Viral Suppression

Retention in HIV medical care was defined as people with HIV who had at least two medical visit dates that were at least 90 days apart in the measurement year. Because the data sets are restricted to one calendar year of data each, the first of these HIV medical care visits in the year must have occurred before September 1 of the measurement year, thus giving the client an opportunity to meet the retention criteria by December 31.

Viral suppression was based on data for people with HIV who had at least one OAHS visit and at least one viral load test during the measurement year. Viral suppression was defined as the most recently reported HIV RNA test result of <200 copies/mL.

Priority Populations

Although anyone can have HIV, all people and communities are not impacted equally. HRSA HAB has enhanced its efforts to focus on communities where HIV is most concentrated. These priority populations include women; transgender women; gay, bisexual, and other MSM; Blacks/African Americans; Hispanics/Latinos; youth; young Black/African American MSM; young Black/African American women; people with HIV attributed to injection drug use; and people with unstable or temporary housing. Tables 11a through 18b display retention in care (“a” tables) and viral suppression (“b” tables) for these priority populations.

^a Hispanics/Latinos can be of any race.

^b Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^c Includes hemophilia and blood transfusion.

^d Subtotals are reflective of available gender and transmission category information. The values may not sum to the subtotals for gender overall.

^e Includes any sexual transmission category reported by transgender clients.

^f Subtotals for each subpopulation are displayed to reflect the denominator used for the percentage calculation of each subpopulation; due to missing data, the values in each column may not sum to the column total.

Abbreviation: FPL, federal poverty level.

^a Hispanics/Latinos can be of any race.

^b Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^c Includes hemophilia and blood transfusion.

^d Subtotals are reflective of available gender and transmission category information. The values may not sum to the subtotals for gender overall.

^e Includes any sexual transmission category reported by transgender clients.

^f Subtotals for each subpopulation are displayed to reflect the denominator used for the percentage calculation of each subpopulation; due to missing data, the values in each column may not sum to the column total.

^a Hispanics/Latinos can be of any race.

^b Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^c Includes hemophilia and blood transfusion.

^d Subtotals are reflective of available gender and transmission category information. The values may not sum to the subtotals for gender overall.

^e Includes any sexual transmission category reported by transgender clients.

^f Subtotals for each subpopulation are displayed to reflect the denominator used for the percentage calculation of each subpopulation; due to missing data, the values in each column may not sum to the column total.

Note: See Technical Notes for the states/territories included in each region.

^a Hispanics/Latinos can be of any race.

^b Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^c Includes hemophilia and blood transfusion.

^d Subtotals are reflective of available gender and transmission category information. The values may not sum to the subtotals for gender overall.

^e Includes any sexual transmission category reported by transgender clients.

^f Subtotals for each subpopulation are displayed to reflect the denominator used for the percentage calculation of each subpopulation; due to missing data, the values in each column may not sum to the column total.

Section 2.

National-Level Data: Retention in Care and Viral Suppression

Table 9. Retention in care among Ryan White HIV/AIDS Program clients (non-ADAP), by year and selected characteristics, 2016–2020—United States and 3 territories

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

^a Hispanics/Latinos can be of any race.

^b Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^c Includes hemophilia and blood transfusion.

^d Includes any sexual transmission category reported by transgender clients.

^e Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

^a Hispanics/Latinos can be of any race.

^b Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^c Includes hemophilia and blood transfusion.

^d Includes any sexual transmission category reported by transgender clients.

^e Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

^a Hispanics/Latinas can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^d Includes hemophilia and blood transfusion.

^e See Technical Notes for the states/territories in each region.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

^a Hispanics/Latinos can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^d Includes hemophilia and blood transfusion.

^e See Technical Notes for the states/territories in each region.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

* To ensure confidentiality, data have been suppressed.

^a Hispanics/Latinos can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c Includes any sexual transmission category reported by transgender clients.

^d Includes hemophilia and blood transfusion.

^e See Technical Notes for the states/territories in each region.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

* To ensure confidentiality, data have been suppressed.

^a Hispanics/Latinos can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c Includes any sexual transmission category reported by transgender clients.

^d Includes hemophilia and blood transfusion.

^e See Technical Notes for the states/territories in each region.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

^a Hispanics/Latinos can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^d Includes hemophilia and blood transfusion.

^e Includes any sexual transmission category reported by transgender clients.

^f See Technical Notes for the states/territories in each region.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Note: Data are included only for males with the transmission category male-to-male sexual contact; data do not include male clients who reported male-to-male sexual contact and injection drug use.

^a Hispanics/Latinos can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c See Technical Notes for the states/territories in each region.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

^a Hispanics/Latinas can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^d Includes hemophilia and blood transfusion.

^e See Technical Notes for the states/territories in each region.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Notes: Data presented in this table represent clients who reported injection drug use as their transmission category; data may not be reflective of current injection drug use behavior.

Data are included only for clients with the transmission category injection drug use; data do not include male clients who reported male-to-male sexual contact and injection drug use or transgender clients who reported sexual contact and injection drug use.

^a Hispanics/Latinos can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c See Technical Notes for the states/territories in each region.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: Data presented in this table represent clients who reported injection drug use as their transmission category; data may not be reflective of current injection drug use behavior.

Data are included only for clients with the transmission category injection drug use; data do not include male clients who reported male-to-male sexual contact and injection drug use or transgender clients who reported sexual contact and injection drug use.

^a Hispanics/Latinos can be of any race.

^b Because totals were calculated independently of the values for the subpopulations, the values in each column and row may not sum to the column and row totals.

^c See Technical Notes for the states/territories in each region.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

^a Hispanics/Latinos can be of any race.

^b Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^c Includes hemophilia and blood transfusion.

^d Includes any sexual transmission category reported by transgender clients.

^e See Technical Notes for the states/territories in each region.

^f Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

^a Hispanics/Latinos can be of any race.

^b Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^c Includes hemophilia and blood transfusion.

^d Includes any sexual transmission category reported by transgender clients.

^e See Technical Notes for the states/territories in each region.

^f Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Notes: Percentages shown are based on the row total.

EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Notes: Percentages shown are based on the row total.

EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

* To ensure confidentiality, calculations with a denominator less than (<) 5 have been suppressed; in addition, all data for clients of multiple races have been suppressed. Therefore, the numbers for each subpopulation may not sum to the row total.

^a Hispanics/Latinos can be of any race.

^b Includes all clients with reported race/ethnicity information.

^c The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Notes: Percentages shown are based on the row total.

EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

* To ensure confidentiality, calculations with a denominator less than (<) 5 have been suppressed; in addition, all data in the Other gender identity category have been suppressed. Therefore, the numbers for each subpopulation may not sum to the row total.

^a Includes all clients with reported gender information.

^b The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Notes: Percentages shown are based on the row total.

EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^b Includes hemophilia and blood transfusion.

^c The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Abbreviations: EMA, eligible metropolitan area; FPL, federal poverty level; TGA, transitional grant area.

Notes: Percentages shown are based on the row total.

EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Notes: Percentages shown are based on the row total.

EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Section 4.

State- and EMA/TGA-Level Data: Retention in Care and Viral Suppression

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.
Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column subtotals and totals.
 2019 and 2020 data for Guam are unavailable.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column subtotals and totals.

2019 and 2020 data for Guam are unavailable.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column subtotals and totals.

2020 data for Guam are unavailable.

Abbreviation: EMA, eligible metropolitan area; TGA, transitional grant area.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column subtotals and totals.

2020 data for Guam are unavailable.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column subtotals and totals.

2020 data for Guam are unavailable.

^a Hispanics/Latinos can be of any race.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

* To ensure confidentiality, calculations with a denominator less than (<) 5 have been suppressed; in addition, all data for clients of multiple races have been suppressed.

^a Hispanics/Latinos can be of any race.

^b The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column subtotals and totals.

2020 data for Guam are unavailable.

^a Hispanics/Latinos can be of any race.

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

* To ensure confidentiality, calculations with a denominator less than (<) 5 have been suppressed; in addition, all data for clients of multiple races have been suppressed.

^a Hispanics/Latinos can be of any race.

^b The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Abbreviation: FPL, federal poverty level.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column subtotals and totals.

2020 data for Guam are unavailable.

Abbreviations: EMA, eligible metropolitan area; FPL, federal poverty level; TGA, transitional grant area.

Retention in care was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit by September 1 of the measurement year, with a second visit at least 90 days after.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Abbreviation: FPL, federal poverty level.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column subtotals and totals. 2020 data for Guam are unavailable.

Abbreviations: EMA, eligible metropolitan area; FPL, federal poverty level; TGA, transitional grant area.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: Data are based on provider location. Clients receiving services in multiple states were not included in state-specific totals or column 2020 data for Guam are unavailable.

Table 35b. Viral suppression among Ryan White HIV/AIDS Program clients (non-ADAP), by housing status and eligible metropolitan area and transitional grant area, 2020—United States and Puerto Rico

Abbreviations: EMA, eligible metropolitan area; TGA, transitional grant area.

Viral suppression was based on data for people with HIV who had at least 1 outpatient ambulatory health services visit during the measurement year and whose most recent viral load test result was <200 copies/mL.

Notes: EMAs/TGAs are listed according to the primary state in which the jurisdiction resides. EMA/TGA delineations are based on provider location.

Data shown for individual EMAs and TGAs are not mutually exclusive; clients may have received services from providers in multiple EMAs and/or TGAs.

^a The EMA/TGA service area crosses state boundaries. See Technical Notes for more information.
